Below is a **step-by-step diagnostic checklist** you can follow (or embed in your support-tooling) to pinpoint why a ₹ 50,000 intra-bank transfer is returning the generic message **“Transaction could not be completed.”**

For each step note the data you need, the decision point, and the recommended remedial action.

1️⃣ Gather the basics

Item	Where to find it	What to verify
Customer ID / Account No.	Transaction log, UI screen, or support ticket	Correct account is being used.
Timestamp of attempt	Transaction audit log	Within the same business day?
Beneficiary details (IFSC, account no., name)	Saved beneficiary list or entered data	Exact match with bank’s master data.
Transaction amount	UI / log	₹ 50,000 (above the amount you are testing).
Error payload (if any)	API response, mobile-app logs, or server trace	Look for hidden error codes (e.g., `ERR_0012`).
Device / channel	Mobile app, web, USSD, IVR	Identify if the issue is channel-specific.

> **Why?** A lot of “generic” messages hide a more specific error code that can be extracted from logs or the API response. If you can get that code, you’ll often jump straight to the root cause.

2️⃣ Validate **Daily / Transaction Limits**

Check	How to check	What to do if it fails
Customer-specific daily debit limit	Pull the limit from the **Limits Service** (e.g., `GET /customers/{id}/limits`).	If ₹ 50,000 > remaining daily quota → **Reject** with “Daily limit exceeded” and show the exact remaining limit.
Per-transaction ceiling	Same service, field `maxPerTxn`.	If amount > ceiling → “Transaction amount exceeds per-transaction limit.”
Aggregate limit for the day	Sum of successful debits today + amount being attempted.	If sum > daily limit → “Daily limit exceeded.”

Remedy for the customer
- Ask them to split the transfer into smaller amounts.
- If the limit is set too low, raise a request with the **Limits Management** team to increase it (subject to KYC/AML policy).

3️⃣ Verify **Account Balance**

Check	How to check	What to do if insufficient
Available balance (including hold amounts)	Query **Core Banking** (`GET /accounts/{acct}/balance`).	If balance < ₹ 50,000 → “Insufficient balance.”
Over-draft / credit line	Same service, field `overdraftLimit`.	If overdraft can cover shortfall, allow; otherwise, reject.
Pending debits (e.g., scheduled payments)	Pull from **Pending Transactions** table.	Subtract pending amounts from balance before comparison.

Remedy
- Ask the customer to deposit funds.
- If the balance appears correct but still fails, move to the next step (possible stale cache).

4️⃣ Check **Beneficiary Status**

Check	How to check	What to do if inactive
Beneficiary record existence	`GET /beneficiaries/{id}`.	If not found → “Beneficiary not found.”
Beneficiary active flag	Field `status` (`ACTIVE`, `INACTIVE`, `BLOCKED`).	If not `ACTIVE` → “Beneficiary is inactive / blocked.”
IFSC / account number validation	Run through **IFSC validation service**.	If mismatch → “Invalid beneficiary details.”
Black‑list check	Run against **Sanctions/Blacklist** DB.	If flagged → “Beneficiary prohibited.”

Remedy
- Ask the customer to re‑add or correct the beneficiary.
- If the beneficiary was recently blocked due to fraud, provide a case reference.

5️⃣ Confirm **OTP (One‑Time Password) Flow**

Check	How to check	What to do if OTP failed
OTP generated	Look for `OTP_SENT` event in audit log.	If missing → “OTP service unavailable.”
OTP entered	Verify `OTP_SUBMITTED` event timestamp.	If not present → “OTP not entered.”
OTP expiry	OTP TTL usually 2‑5 min. Compare timestamps.	If expired → “OTP expired, please request a new one.”
OTP validation result	`OTP_VERIFIED` = true/false.	If false → “Invalid OTP.”

Remedy
- Prompt the customer to request a fresh OTP.
- If the OTP service itself is down, raise an incident with the **Auth Service** team.

6️⃣ Detect **Network / Timeout Issues**

Symptom	How to detect	Action
HTTP 5xx or gateway timeout	Look at API gateway logs (`status >=500`).	If present → “Network timeout / server unavailable.”
Client‑side connectivity loss	Mobile app logs show `NetworkError`.	Ask user to retry on a stable connection (Wi‑Fi / 4G).
Long processing time (>30 s)	Check `requestStart` → `requestEnd`.	If >30 s → “Transaction timed out, please retry.”

Remedy
- Simple retry often succeeds.
- If repeated, open a ticket with **Network Ops**.

7️⃣ Verify **Bank / Core Banking Availability**

Check	How to check	What to do if down
Core Banking health endpoint (`GET /health/core`)	Returns `UP` or `DOWN`.	If `DOWN` → "Core banking system unavailable."
Batch processing window	Check schedule (e.g., nightly batch).	If within batch window, advise to try after it ends.
System alerts	Dashboard (Splunk/Datadog) for `CORE_ERR` alerts.	Escalate to **Core Ops**.

Remedy
- Inform the customer of the outage and give an ETA.
- Log the incident for SLA tracking.

8️⃣ Check **Fraud / Rule Engine Triggers**

Check	How to check	What to do if triggered
Risk score	Call **Fraud Service** (`POST /risk/evaluate`).	If score > threshold → "Transaction blocked by fraud rules."
Rule list	Retrieve `violatedRules` from the response.	Identify which rule (e.g., "large single-day transfer to new beneficiary").
Manual review flag	Field `requiresManualReview`.	If true → place transaction in **Pending Review** queue.

Remedy
- Explain to the customer why the rule fired (e.g., large transfer to a new payee).
- Offer to submit supporting documents for manual clearance.

9️⃣ Confirm **UPI Switch / External Switch Availability** (if the transfer uses UPI)

Check	How to check	Action
UPI Switch health (`GET /upi/health`)	Returns `UP`, `DOWN`, or `DEGRADED`.	If not `UP` → "UPI switch unavailable."
UPI transaction status	Query `GET /upi/transactions/{txnId}`.	If status = `FAILED` with code `UPI_503` → "UPI switch down."
Switch latency	Measure round-trip time.	> 5 s → "Switch latency, retry later."

Remedy
- Suggest an alternate channel (NEFT/IMPS) until UPI is restored.
- Log the incident with the **UPI Operations** team.

10️⃣ Final Decision Matrix

Root Cause	Decision	Customer Message (friendly)

| Daily limit exceeded | **Reject** | “You have reached your daily transfer limit. You can transfer up to ₹ X more today or try again tomorrow.”
